

5                   Avian Hepatitis E Virus, Vaccines and Methods of Protecting  
                    Against Avian Hepatitis-Splenomegaly Syndrome  
                    and Mammalian Hepatitis E

                    ABSTRACT OF THE DISCLOSURE

10           The present invention relates to a novel isolated avian hepatitis E virus having a  
          nucleotide sequence set forth in SEQ ID NO:1 or its complementary strand. The  
          invention further concerns immunogenic compositions comprising this new virus or a  
          recombinant products such as the nucleic acid and vaccines that protect an avian or  
15           mammalian species from viral infection or hepatitis-splenomegaly syndrome caused by  
          the hepatitis E virus. Also included in the scope of the invention is a method for  
          propagating, inactivating or attenuating a hepatitis E virus comprising inoculating an  
          embryonated chicken egg with a live, pathogenic hepatitis E virus and recovering the  
          virus or serially passing the pathogenic virus through additional embryonated chicken  
20           eggs until the virus is rendered inactivated or attenuated. Further, this invention concerns  
          diagnostic reagents for detecting an avian hepatitis E viral infection or diagnosing  
          hepatitis-splenomegaly syndrome in an avian or mammalian species comprising an  
          antibody raised or produced against the immunogenic compositions and antigens such as  
          ORF2 proteins expressed in a baculovirus vector, *E. coli*, etc. The invention additionally  
25           encompasses methods for detecting avian HEV nucleic acid sequences using nucleic acid  
          hybridization probes or oligonucleotide primers for polymerase chain reaction (PCR).
